

Helium Gas Cylinders

We take the safety of our customers and whoever may come into contact with our products very seriously. We recommend that you always follow the safety instructions.

- ✗ **Never allow** children or any unauthorised person to handle the cylinder or to use balloon filling equipment.
- ✓ Before use the helium cylinder **MUST** be safely secured to prevent falling/toppling over.
- ✗ The cylinder contains compressed helium under pressure. **Do not** place nozzle in mouth or nose for any reason. Doing so can damage lungs and other body parts, which can result in serious personal injury or death.
- ✗ **Do not** inhale helium. Use only in a well ventilated area. Never use in closed spaces. Helium reduces and can eliminate oxygen available for breathing. Inhaling helium can result in serious personal injury or death.
- ✗ **Do not** store in damp areas. This can cause the cylinder to rust. Rusting of the cylinder can result in a violent bursting of the cylinder resulting in serious personal injury or death.
- ✗ **Never expose** the tank to direct heat or fire. Exposure to those conditions could result in the operation of the pressure relief device, which will result in sudden discharge of pressure from the cylinder resulting in serious personal injury.
- ✗ **Do not** mistreat the tank by dropping on sharp or pointed surfaces. This could puncture the tank causing a sudden release of the contents resulting in serious injury or death.
- ✓ If transporting the cylinder by car, ensure that the vehicle is well ventilated and the cylinder is well secured.
- ✗ Never open the cylinder valve without fitting an inflator nozzle first. Then proceed to open the valve slowly.
- ✓ When inflating balloons, always point the balloon and inflator nozzle away from you.
- ✓ Remember to close the cylinder valve after use.
- ✗ For non-refillable cylinders, **do not** refill with any material. This could result in violent bursting of the cylinder resulting in serious personal injury or death.
